

Organizations for Rural Quality

of Nevada County

Nevada County Has an Unknown Supply of Water

What will happen if we continue to build?

- 60% of Nevada county homes are on ground water wells
- The 1995 General Plan required the County to develop a data log to monitor ground water supply and quality
- This study was to assist in decision making for new building and development
- After 10 years, no study has been done
- Availability and quality of our groundwater is still unknown
- Our officials are being forced to make decisions regarding development and building without enough information about our water supply
- This is gambling on the capacity of an unknown groundwater system
